Introduction

This document has been created to provide developers with a reference to integrate into the 543 Web Service. It is assumed that the reader is familiar with SOAP based web services and SSL security. The web service allows the integrating system to use 543 Electronic Voucher Distribution to purchase vouchers, reconcile, query the merchant balance and generate or process CashOut codes.

For any further queries please contact cGrate IT Support

Email: it-support@cgrate.co.zm

Phone: +26 02 11 840004

Return Types

Every web method in Konik returns an object that extends the `CResponse` class. This provides the client a standard way of retrieving a response code and message. The other parameters contained within the web method's response object will naturally be specific to what is returned by the method.

Table 1 - CResponse class

CResponse		
Field	Type	Detail
responseCode	int	A global response code indicating the outcome of the operation
responseMessage	string	A message describing the response code

Getting Started

This is a quick guide to take you through setting up your client step by step.

1. **Generate client stubs from WSDL file**
 - a. There are various tools for generating the client classes required to consume a web service.
2. **Implement the security**
 - a. Ensure that your SOAP request contains the UsernameToken that is required by the 543 web service to authenticate you.
3. **Check that you have connectivity and authentication**
 - a. Call the `getAccountBalance()` method to test your client. If you receive response code 0 you have successfully created the client.
4. **Perform a voucher purchase**
 - a. Get list of valid vouchers using the `getVouchers()` method.
 - b. Use the fields returned from that method to create your `VoucherDataWs` object
 - c. Call the `purchaseVoucher()` method with the previously created object
 - d. Check that the response you receive is as expected.

Response Codes

A list of all response codes given by the Konik system. Every response code is unique, so they have been divided into sections categorizing them according to functionality.

Table 2 - Response Codes

Category	Range	Code	Meaning
General	0-30	0	Success
		1	Insufficient balance
		6	General error
		7	Invalid MSISDN
		8	Process delay
		9	Balance update failed
		10	Balance retrieval failed
Active	31-50	31	Account is active
		32	Account is inactive
		33	Account is suspended
		34	Account is closed
		35	Password tries exceeded
		36	Incorrect password
		37	Account does not exist
Voucher Providers	51-100	51	Insufficient stock
		52	Invalid voucher request
		53	Invalid recharge
		54	Invalid recharge denomination
		55	Voucher Provider content failed
		56	Invalid Voucher Provider
Channels	101-150	101	Invalid distribution channel
		102	USSD transaction not available
Reconciliation	151-200	151	Reconciliation failed
		152	No reconciliation found
		153	Reconciliation flag not consistent with count
		154	Error receiving reconciliation total

Web Methods

In here you will find the details on how to call and use the various web methods exposed by the 543 web service.

Account Balance

This method allows the merchant to query their running balance in Konik. It is a real time figure and will reflect the exact balance at that point in time.

```
BalanceResponse getAccountBalance ()
```

Parameters:

none

Returns:

BalanceResponse

Detail

The BalanceResponse class extends the CResponse class.

Table 3 - Balance Response

BalanceResponse		
Field	Type	Detail
balance	decimal	The current merchant's balance

Purchase Voucher

Allows for the purchase of a single voucher from any available voucher provider. Notice that it is important to call this method with the correct arguments to perform a successful purchase. For instance, attempting to distribute pin-less airtime by the file channel will result in a failed transaction.

```
PurchaseResponse purchaseVoucher(VoucherDataWs)
```

Parameters

VoucherDataWs

Returns

PurchaseResponse

Detail

This method requires a `VoucherDataWs` object to be built as the parameter. It contains all the fields necessary to purchase a single voucher.

Table 4 – Voucher Data

VoucherDataWs		
Field	Type	Detail
distributionChannel	string	The means by which the voucher is delivered to the recipient. The permitted values are given by the <code>getDistributionChannels</code> method.
isFixed	boolean	Specifies if the provided amount will be variable or fixed to a particular voucher
recipient	string	Identifier of the individual receiving the voucher. This can be a MSISD, account number, meter number etc. depending on what the voucher provider provides.
serviceProvider	string	The organization providing the voucher being purchased. The permitted values are given by the voucher provider elements in the <code>getVouchers</code> method.
voucherType	string	The voucher category specific to the voucher provider. The list of permitted values along with their corresponding voucher providers is given by the <code>getVouchers</code> method.
voucherValue	long	Amount in cents of the voucher's worth

Once this object has been created the `purchaseVoucher` method may be called and it will return a `PurchaseResponse` object.

PurchaseResponse Detail

This object extends `CResponse`, so will have the inherited members `responseCode` and `responseMessage`.

Table 5 - Purchase Response

PurchaseResponse		
Field	Type	Detail
purchaseld	string	A unique number to identify this purchase.
merchantVoucherValue	decimal	The cost of the voucher to the merchant.
voucherPinNumber	string	The voucher PIN returned by the voucher provider encrypted. Note that a pin less recharge will result in a null pin.
voucherSerialNumber	string	A number that identifies the voucher with the voucher provider. This number can be used to query any purchased voucher with the voucher provider themselves. Note if the voucher provider does not support serial numbers this field will be null

Purchase Zesco Voucher

Allows for the purchase of a single Zesco voucher. Notice that its is important to call this method with the correct arguments to perform a successful Zesco purchase.

```
PurchaseZescoResponse purchaseZescoVoucher(VoucherDataWs)
```

Parameters:

`VoucherDataWs`

Returns:

`PurchaseZescoResponse`

VoucherDataWs Detail

This method requires a `VoucherDataWs` object to be built as the parameter. It contains all the fields necessary to purchase a single voucher.

Table 6 - Purchase Zesco - Data Voucher

VoucherDataWs - Zesco Purchase		
Field	Type	Detail
distributionChannel	string	The means by which the voucher is delivered to the recipient. The permitted values are given by the <code>getDistributionChannels</code> method.
isFixed	boolean	Specifies if the provided amount will be variable or fixed to a particular voucher
recipient	string	Identifier of the individual receiving the voucher. This can be a MSISD, account number, meter number etc. depending on what the voucher provider provides.
serviceProvider	string	The organization providing the voucher being purchased. The permitted values are given by the voucher provider elements in the <code>getVouchers</code> method.
voucherType	string	The voucher category specific to the voucher provider. The list of permitted values along with their corresponding voucher providers is given by the <code>getVouchers</code> method.
voucherValue	long	Amount in cents of the vouchers worth

Once this object has been created the `purchaseZescoVoucher` method may be called and it will return a `PurchaseZescoResponse` object.

PurchaseResponse Detail

This object extends `CResponse`, so will have the inherited members `responseCode` and `responseMessage`.

Table 7 - Purchase Zesco Voucher Response

PurchaseResponse - Zesco		
Field	Type	Detail
purchaseld	string	A unique number to identify this purchase.
merchantVoucherValue	decimal	The cost of the voucher to the merchant.
voucherPinNumber	string	The voucher PIN returned by the voucher provider encrypted. Note that a pin-less recharge will result in a null pin.
voucherSerialNumber	string	A number that identifies the voucher with the voucher provider. This number can be used to query any purchased voucher with the voucher provider themselves. Note if the voucher provider does not support serial numbers this field will be null
customerAccountNumber	string	Customer meter number
customerAddress	string	Customers physical address
customerName	string	Name of the customers
debtBalBfwd	string	Balance brought forward on the customers account
debtBalance	string	Debt balance on the customers account
elecSerial	string	The serial number of the token
exciseDuty	string	Duty charged on the token purchased
fixedCharge	string	Fixed charge of the token purchase
receiptNumber	string	Receipt unique number
serviceNumber	string	Service number
tariff	string	Tariff used
tariffIndex	string	Tariff index
totalVAT	string	VAT
tvLicence	string	TV license
units	string	Token Units
kWhAmount	string	kWh Amount
additionalPinsCount	int	The count of the additional pins to be expected
additionalPins	String []	An array of additional pins

NB: Zesco at times issues multiple tokens for various reasons, in 2020 some customers were receiving Covid relief tokens in addition to the normal token. From 2023 to 2024, Zesco will be issuing 2 additional tokens to upgrade meters. Developers should look out for additional tokens in the additionalPins array.

It is advisable to issue the tokens in the sequence that they are listed in the Soap response i.e. the voucherPinNumber as the 1st token, then the ones in the array following.

The additionalPins array is empty if there are not extra tokens. Developers can also use the additionalPinsCount element to determine the number additional pins in the array

To test multiple pins in UAT, please use meter number “123456789”, any other number will return an empty array.

Query Transaction Status

Allows customer to query the status of the transaction.

```
CResponse queryTransactionStatus(transactionReference)
```

Parameter

```
transactionReference
```

Returns

```
CResponse
```

Detail

The `transactionReference` is a single string passed as a parameter in the `queryTransactionStatus` method.

Once this object has been created the `queryTransactionStatus` method may be called and it will return a `CResponse` object outlined in Table 1.

Validate Voucher Purchase

This method validates the voucher being purchased before it is sent for processing to the service provider.

```
ValidatePurchaseResponse validateVoucherPurchase(VoucherDataWs)
```

Parameter

```
VoucherDataWs
```

Returns

```
ValidatePurchaseResponse
```

VoucherDataWs Detail

This method requires a `VoucherDataWs` object to be built as the parameter. It contains all the fields necessary to purchase a single voucher.

Table 8 - Voucher details

VoucherDataWs - Validate Purchase		
Field	Type	Detail
distributionChannel	string	The means by which the voucher is delivered to the recipient. The permitted values are given by the <code>getDistributionChannels</code> method.
isFixed	boolean	Specifies if the provided amount will be variable or fixed to a particular voucher
recipient	string	Identifier of the individual receiving the voucher. This can be a MSISD, account number, meter number etc. depending on what the voucher provider provides.
serviceProvider	string	The organization providing the voucher being purchased. The permitted values are given by the voucher provider elements in the <code>getVouchers</code> method.
voucherType	string	The voucher category specific to the voucher provider. The list of permitted values along with their corresponding voucher providers is given by the <code>getVouchers</code> method.
voucherValue	long	Amount in cents of the voucher's worth

Once this object has been created the `validateVoucherPurchase` method may be called and it will return a `ValidatePurchaseResponse` object.

This object extends `CResponse`, so will have the inherited members `responseCode` and `responseMessage`.

Reconcile

The reconcile method allows the merchant to verify their sales with Konik. The method works in a progressive manner, meaning that it will reconcile all transactions from the last reconciled one to the last transaction performed before the reconciliation. Once a transaction has been reconciled it is marked as such in the system and will never be reconciled again. The method therefore takes no parameters and returns an object that contains the reconciliation information.

```
ReconResponse reconcile()
```

Parameters

none

Returns:

ReconResponse

Detail

The ReconResponse class extends the CResponse class.

Table 9 – ReconResponse response

ReconResponse		
Field	Type	Detail
reconDate	date	The timestamp of this reconciliation operation
runningBalance	decimal	Merchant's balance at that point in time
faceValuePurchased	decimal	Total amount purchased at face value (i.e. K30 voucher is K30)
merchantValuePurchased	decimal	Total amount purchased at merchant discount (i.e. K30 could be K28)
reconId	string	Number uniquely identifying this reconciliation
totalCount	long	Total number of vouchers purchased

Vouchers

Returns a list of vouchers that are available for the authenticated merchant. Should a recharge fail of a voucher that has been used before this is a good checking point to establish if the voucher is still available.

```
VouchersResponse getVouchers()
```

Parameters:

none

Returns:

VouchersResponse

Detail

The VouchersResponse class extends the CResponse class.

Table 10 - Voucher Response

VouchersResponse		
Field	Type	Detail
voucherDetails	VoucherDetail[]	An array containing voucher information

Table 11 - Voucher details

VoucherDetail		
Field	Type	Detail
voucherId	string	A unique identifier for a voucher
serviceProvider	string	The organization providing the voucher
voucherType	string	A voucher category
voucherValue	decimal	The face value of the voucher
isFixed	boolean	Flag indicating if the value may be variable or not

Vouchers with Units

Returns a list of vouchers with their units (amounts) that are available for the authenticated merchant. Should a recharge fail of a voucher that has been used before this is a good checking point to establish if the voucher is still available.

```
ExtendedVouchersResponse getVouchersWithUnits()
```

Parameters:

none

Returns:

```
ExtendedVouchersResponse
```

Detail

The `ExtendedVouchersResponse` class extends the `CResponse` class.

Table 12 - Extended Voucher Response

ExtendedVouchersResponse		
Field	Type	Detail
voucherDetails	ExtendedVoucherDetail []	An array containing voucher information

Table 13 - Extended Voucher Details

ExtendedVoucherDetail		
Field	Type	Detail
voucherId	string	A unique identifier for a voucher
serviceProvider	string	The organization providing the voucher
voucherType	string	A voucher category
voucherValue	decimal	The face value of the voucher
isFixed	boolean	Flag indicating if the value may be variable or not
voucherUnits	long	Unit of the voucher e.g. 10GB bundle

Distribution Channels

Provides the list of supported distribution channels. Note though that not all distribution channels are necessarily available for all voucher purchases, for instance, if one is purchasing pin-based Airtel airtime, selecting the NODISTRIBUTION channel will result in a failed recharge since the PIN number needs to be supplied by some means.

```
ChannelsResponse getDistributionChannels()
```

Parameters:

none

Returns:

ChannelsResponse

Detail

The ChannelsResponse class extends the CResponse class.

Table 14 - Distribution channel response

ChannelsResponse		
Field	Type	Detail
distributionChannels	string[]	An array containing the allowed distribution channels.

Generate CashOut Code

This is the request for a CashOut code by the issuing institution. The code generated can be used at any 543 retailer.

```
LokaiCashOutCode generateCashOutCode (CustomerDetails)
```

Parameters:

```
CustomerDetails
```

Returns:

```
LokaiCashOutCode
```

Detail

The `LokaiCashOutCode` class extends the `CResponse` class.

Table 15 - Generate cashout code

Generate CashOut Details (CustomerDetails)		
Field	Type	Detail
customerName	string	Customers first name
customerSurname	string	Customers surname
cashOutAmount	BigDecimal	Amount
transactionReference	string	Unique transaction reference used to generate the code
customerMobile	string	Customers mobile number
customerAccountID	string	Customers account number

Once this object has been created the `generateCashOutCode` method may be called and it will return a `LokaiCashOutCode` object.

This object extends `CResponse`, so will have the inherited members `responseCode` and `responseMessage`.

Table 16 - CashOut Code Respose

LokaiCashOutCode		
Field	Type	Detail
cashOutCode	string	CashOut code

Process CashOut

This is the process where the customer goes to the merchant to withdraw funds using the generated CashOut code.

```
CResponse processCashOut(CashOutDetails)
```

Parameter

```
CashOutDetails
```

Returns

```
CResponse
```

Detail

Returns Table 1

Table 17 - Process CashOut

CashOutDetails		
Field	Type	Detail
cashOutCode	string	CashOut code generated.
customerMobile	string	Customers mobile number
cashierID	int	The cashier of the POS terminal

Query CashOut

This process queries the status of the CashOut code using the method `checkCashOutCodeStatus`

```
CashOutCodeStatus checkCashOutCodeStatus (cashOutcode,
customerMobile)
```

Parameters

```
cashOutcode, customerMobile
```

Returns

```
CResponse
```

Details

Returns Table 1

Table 18 - CashOut parameter details

CashOutDetails		
Field	Type	Detail
cashOutCode	String	The generated CashOut code.
customerMobile	String	Customers mobile number used to generate the CashOut code.

Bill Payment Balance Due

This checks the balance due on an account.

```
BalanceResponse getBillPaymentBalanceDue(serviceProvider,  
billPaymentAccountNumber)
```

Parameters

```
serviceProvider, billPaymentAccountNumber
```

Returns

```
BalanceResponse
```

Details

Returns the `BalanceResponse` class which extends the `CResponse` class.

Table 19 - Bill Payment Balance Due Response

BalanceResponse		
Field	Type	Detail
balance	BigDecimal	Balance value

Table 20 - Bill Balance Due Parameters

Parameters		
Field	Type	Detail
serviceProvider	String	The service provider
billPaymentAccountNumber	String	The smartcard number or account number.

Last Vouchers Purchased

This returns the last three vouchers or tokens purchased on a Zesco meter number.

```
LastVouchersResponse getLastVouchersPurchased(serviceProvider,  
billPaymentAccountNumber, countOfVouchers)
```

Parameters

```
serviceProvider, billPaymentAccountNumber, countOfVouchers
```

Returns

```
LastVouchersResponse
```

Details

Returns the `LastVouchersResponse` class which extends the `CResponse` class.

Table 21 - GetLastVoucherPurchased paramter description

Parameters		
Field	Type	Detail
serviceProvider	String	The service provider
billPaymentAccountNumber	String	The smartcard number or account number.
countOfVouchers	int	Number of vouchers to be returned. Max = 3

Table 22 - lastVoucherPurchase response

LastVouchersResponse		
Field	Type	Detail
wsVouchers	String[]	Array list containing list of last vouchers purchased

Load Collection

This loads a collection into the merchants account when the deposit hits the cGrate bank account.

```
CollectionResponse loadCollection(customerMSISDN,
    paymentReference, paymentTimeStamp, paymentAmount,
    paymentChannel)
```

Parameters

```
customerMSISDN, paymentReference, paymentTimeStamp,
    paymentAmount, paymentChannel
```

Returns

```
CollectionResponse
```

Details

Returns the `CollectionResponse` class which extends the `CResponse` class.

Table 23 - loadCollection parameters

Parameters		
Field	Type	Detail
customerMSISDN	String	Merchants phone number
paymentReference	String	Transaction reference
paymentTimeStamp	XMLGregorianCalendar	Date of posting
paymentAmount	double	Amount to be posted
paymentChannel	String	Channel

Table 24 - loadCollection response

CollectionResponse		
Field	Type	Detail
loadCollectionReference	String	Internal tran reference.

Query Collection

This queries the status of a collection which was done into the merchants account.

```
CollectionResponse queryCollection(paymentReference)
```

Parameters

```
paymentReference
```

Returns

```
CollectionResponse
```

Details

Returns the `CollectionResponse` class which extends the `CResponse` class.

Table 25 - queryCollection parameters

Parameters		
Field	Type	Detail
paymentReference	String	Transaction reference

Table 26 - queryCollection response

CollectionResponse		
Field	Type	Detail
loadCollectionReference	String	Internal transaction reference.

Reverse Collection

This queries the status of a collection which was done into the merchants account.

```
CollectionResponse reverseCollection(paymentReference,  
paymentAmount)
```

Parameters

paymentReference

Returns

CollectionResponse

Details

Returns the CollectionResponse class which extends the CResponse class.

Table 27 - reverseCollection parameters

Parameters		
Field	Type	Detail
paymentReference	String	Transaction reference
paymentAmount	double	Transaction amount

Table 28 - reverseCollection response

CollectionResponse		
Field	Type	Detail
loadCollectionReference	String	Internal transaction reference.

Process Customer Payment

This processes a customer payment by sending a payment to the customers mobile via USSD push. Once the customer accepts payment (by inputting the pin) the payment is processed.

```
CustomerPaymentResponse processCustomerPayment(
    transactionAmount, customerMobile, paymentReference)
```

Parameters

```
transactionAmount, customerMobile, paymentReference
```

Returns

```
CustomerPaymentResponse
```

Details

Returns the `CustomerPaymentResponse` class which extends the `CResponse` class.

Table 29 - processCustomerPayment parameter

Parameters		
Field	Type	Detail
customerMobile	String	Customers mobile number
transactionAmount	double	Transaction amount
paymentReference	String	Payment reference

Table 30 - processCustomerPayment response

CustomerPaymentResponse		
Field	Type	Detail
paymentID	String	Internal transaction reference / payment identifier

Query Customer Payment

This queries the status of the customer payment.

```
CustomerPaymentResponse queryCustomerPayment(java.lang.String  
paymentReference)
```

Parameters

paymentReference

Returns

CustomerPaymentResponse

Details

Returns the `CustomerPaymentResponse` class which extends the `CResponse` class.

Table 31 - queryCustomerPayment parameter

Parameters		
Field	Type	Detail
paymentReference	String	Payment reference

Table 32 - queryCustomerPayment response

CustomerPaymentResponse		
Field	Type	Detail
paymentID	String	Internal transaction reference / payment identifier

Reverse Customer Payment

This reverses the customer payment.

```
CResponse reverseCustomerPayment(paymentReference)
```

Parameters

```
paymentReference
```

Returns

```
CResponse
```

Details

Returns Table 1

Table 33 – reverseCustomerPayment parameter

Parameters		
Field	Type	Detail
paymentReference	String	Payment reference

Security

This section provides information on how to authenticate the client onto the Konik web service server.

Implementation

Security on Konik has been implemented in a stateless fashion. Each request to the server requires a UsernameToken to be present in the SOAP header of the request. This means that your transactions with the Konik web service will be individually authenticated, so you will not have to implement any sort of session handling on the client. The UsernameToken in the header will contain your user name and password, which enables the server to identify and authenticate you. Please see the header sample.

UsernameToken

This is a security token that needs to be present in every request sent to the Konik web service. You will be provided with a username and password to authenticate you onto the system when you register with us. As the web service uses SSL it accepts the password in plain text.

WSDL and Samples

This section contains the WSDL and provides samples of request and response codes contained in the web service.

Security Header

```
<soapenv:Header>
  <wsse:Security xmlns:wsse="http://docs.oasis-
open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd"
soapenv:mustUnderstand="1">
    <wsse:UsernameToken xmlns:wsu="http://docs.oasis-
open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"
wsu:Id="UsernameToken-1">
      <wsse:Username>user@organization.com</wsse:Usernam
e>
      <wsse:Password Type="http://docs.oasis-
open.org/wss/2004/01/oasis-200401-wss-username-token-profile-
1.0#PasswordText">P@ssword</wsse:Password>
    </wsse:UsernameToken>
  </wsse:Security>
</soapenv:Header>
```

WSDL

The WSDL file can be found at <http://test.543.cgrate.co.zm/Konik/KonikWs?wsdl>

Account Balance

Request
